Digital Stepping in the Aurora Borealis - an analysis of HAARP

My radio appearance to discuss this article on Feet to the Fire with James Arthur Jancik is available FREE on iTunes [here](#)

Old articles will appear here as I dredge them up.

I will start with the top Jimstonefreelance article ever, which was a team effort:

[Tainted Nightmare](#)

**Upcoming article: Is Intel's Sandy Bridge on a road to nowhere?**

*Intel's new remote kill switch could be used to end computing under the cover of a fake EMP disaster*

Jim Stone, Freelance Journalist, June 4 2011

Zzyzx road California - The last road listed on ANY map.

Within any power structure that has fallen into darkness like America's has, there is a need to control the information received by the governed. Widespread knowledge of even one key truth can bring such power structures to an end; they do, after all, need the will and support of their governed to survive.

The internet was an ambush to them. Initially the "elite" intended computers to be a way to gain access to the most intricate information about people's lives. They used popular bulletin boards such as America Online and Prodigy as spy machines, which worked well because they kept an identity of everyone who posted anything on them. The internet changed that. Because the internet was decentralized and allowed anonymity, it became a potent weapon in the hands of the people, and the elite are desperately seeking ways to shut it down and end computing as we know it.

With entire economic communities, vast numbers of casual users, and widespread communication taking place on the web, shutting it down has become politically impossible without the very real chance of sparking an armed rebellion.

But what if such a shutdown could happen, with the blame directed away from those who caused it? Intel's Sandy bridge technology, which allows remote shutdown of a CPU via the cellular phone network could be used to end computing as we know it if such technologies become widespread and a fake EMP disaster is created as an explanation for why all the computers died. Keep that old PC in the closet!

The article, which will include a detailed presentation on suicide circuits, instructions for how to set up a storage scope to pick up EMP events and properly record them as well as how much energy to expect in a device based upon its cross section, the truthful robustness of modern digital circuits, what the real threats from EMP are and how to avoid them entirely, will post on Saturday/Sunday, June 11/12 at midnight PST. If you think you have been told the truth about EMP, wait until you see this!

For now, here are a few links:
